Project Overview:

HBS Insulated Shipping Containers repurposed at Newcastle United Football Ground

The HBS UK Team worked closely with their local authorised contractor, VP Foam Spray, on insulating repurposed shipping containers in the new fan zone adjacent to St. James' Park. The containers will be in new area called the St. James' STACK at Newcastle United Football Ground. It is expected to be completed in august 2024.

The fan zone will attract people of all ages, with carefully curated events and attractions designed for families. The main stage, complete with a big screen, will be designed to deliver an immersive experience for live entertainment and broadcasting sporting events, while there will be six bars and ten street food units.

The insulation of the containers is being completed using HBS HFO Pro closed-cell spray foam. It is applied to the metal surface of the containers which will then be boarded over the top.

By insulating the container with HBS spray foam, this will significantly improve the thermal efficiency and weather resistance, which will enhance the container's functionality but also contribute to energy savings and environmental sustainability.

VP Foam Spray, HBS autorised installer, is an expert in this application and provide the highest standard of service and quality for spray foam insulation in the UK.
